Choke valves are important for naturally-aspirated gasoline engines because small droplets of gasoline do not evaporate well within a cold engine. By restricting the flow of air into the throat of the carburetor, the choke valve reduces the pressure inside the throat, which causes a proportionally-greater amount of fuel to be pushed from the main jet into the combustion chamber during cold ...

### **Choke valve - Wikipedia**

This contraction pulls on the choke rod and puts pressure on the choke to close completely. When the engine is started, the closed choke creates more vacuum in the engine, pulling in more fuel. As soon as the engine starts, a vacuum is applied to the vacuum choke pull-down servo, which in turn pulls the choke open slightly--just enough to allow enough air into the engine to keep it running.
